SMART GROUND PROJECT

The SMART GROUND project funded by the EU’s Horizon 2020 program intends to improve availability and accessibility of information of the secondary raw material in the EU. The consortium will create a single EU database (SmartGround database) that integrates all the data from existing sources and new information retrieved with time progress. Such database will enable the exchange of contacts and information among the relevant stakeholders (e.g. companies), which are interested in providing or obtaining secondary raw materials. The project produces detailed information of secondary raw materials from three pilot landfills of each partner countries. Aijala tailings pond is one of the Finnish pilots.

AIJALA TAILINGS POND

The Aijala tailing pond consists of two layers: lead rich tailings from Metsämonttu mine and copper rich tailings from Aijala mine. The layers can be distinguished from the geochemical data. Thickness of the tailings pond and bedrock depth were interpreted from gravimetric surveys with bottom of the drill holes as reference points. The final modelling is still in process and it will furthermore be improved by results of electrical resistivity tomography.

MINERAL RESOURCE ESTIMATION

Blocks belonging to Metsämonttu or Aijala mine tailings layers were distinguished with the topography, bedrock, tailings pond bottom surfaces and the interface between the Metsämonttu and Aijala tailings layers. The latter was interpreted from the geochemical change in the drill cores.

INTERPOLATION

Kriging method with horizontal search radius of 200 m in length and width and 2 m in depth was used to interpolate the metal contents in the block model. Copper content is shown as an example.

CONCLUSIONS

The Aijala tailings pond pilot presents an example of a secondary raw material source in EU. The structure of the tailings pond was modelled in 3D. The information concerning the landfill can be found later in the standardised EU landfill databank, and it can be utilised by the possible re-user of the raw material to make feasibility study and planning the operations.

This project has received funding from the European Union’s Horizon 2020 research and innovation programme under Grant Agreement No 641988
